

Content of folder : **MATLAB\Example\Benchmark**

This directory gives a **formal** application of almost all the **SAISIR** function.
It is important to notice that most of the functions are called in approximate alphabetic order of their name, which leads to dummy utilization !

The functions are called from the script `benchmark`.

This gives a way to check that everything is correctly working, and to have examples of input and output arguments of SAISIR functions.

To use the script, you must have installed the MATLAB SAISIR sources (see `readme.pdf` in the `installation` directory).

From MATLAB desktop, go in the directory **MATLAB\Example\Benchmark** and type `benchmark` followed by [carriage return].

The functions are activated. On a normal PC-computer, the total execution of the script requires less than two minutes.
